

# Why I am interested in acute care surgery as my career

Toba Bolaji

For as long as I can remember, in my pursuit of medicine and surgery, I have always been intrigued by the field of trauma. Truthfully, my interest was based in a fantasy of what I thought the field represented and who I thought trauma surgeons were. For me, it meant being a real-life superhero, using your mind and hands to save lives. I assumed the archetype of all trauma surgeons was the person waiting for the next challenge, with nerves of steel and the ability to command a room by their presence. My infatuation was more about the perception of the work, the highs, and the glory.

Surgery is audacious. It's an audacity that is pronounced in trauma surgery. It's a confidence in our training, our knowledge base, practiced maneuvers and skills that says we will save your life. But once you've done the work, and you realize that traumatic injuries can often be unforgiving, there lives a humility in every trauma surgeon that acknowledges that we cannot do it all.

One Saturday morning, while on-call, a page was sent through our hospital overhead system of an incoming trauma code activation 10 mins from the hospital. The trauma surgery team assembled, and hastily made our way down to the trauma bays. There, we received our briefing:

Young African- American male, status post gunshot wound to the right chest. Hypotensive, tachycardic and agonal in the field

With that briefing we knew that his injuries were likely severe. We gathered central lines, betadine cleansing solution and chest tube kits on either side of the room. My chief instructed that I bring out the thoracotomy tray, assume the left chest position, and if the patient entered our bay in cardiac arrest, I should perform an resuscitative thoracotomy.

We heard commotion growing louder as the gurney came down the hallway towards our trauma bays.

They're doing chest compressions!, someone shouted.

With that, everyone in the room looked right at me as I quickly put on my second layer of sterile gloves. The paramedics rolled in, gave a short, panicked briefing, and the second the patient was moved to the bed, I made incision.

It ended up being a long morning, but that young man survived. He had a right ventricular cardiac injury that we repaired in the operating room. Although he wasn't without a tough postoperative course, he was safely discharged home a month later.

Occasionally, every surgeon comes across a patient that changes them. It may change their perspective, or their practice. It may even change their purpose. I have thought of this case almost every week since it happened because it represents something far deeper than surgery for me. By the time he was awake and extubated I knew I had to go introduce myself. I told him I was involved in his case. He thanked me for all we had done for him. And just before I left the room, I felt compelled to tell him that for some reason, a reason I don't know but do know is special, he was given a second chance at life. I told him that less than 1% of people survive what he had been through and that his life is a miracle. He was taken by what I said, and I saw and felt his humanity deeper than I would have thought within a short encounter.

That young man reminded me of myself and so many of the young men I grew up with. Men whose lives were cut short by gun violence. Since this incident, we've lost many more young men, victims of gun violence, who are brought to the emergency department in extremis, who we unfortunately cannot save. Yes, as surgeons, we strive to be better at our craft. We strive to know more. Many of us learn new skills and approaches deep into our career for the purposes of being able to offer our patients better care. But many times, especially in trauma, our efforts are delayed, we aren't good enough and people die. In my short career, I've already

realized that trauma surgeons can't do it all. We are often limited by the boundaries of time, resources, and physiology. But one of the opportunities I have found in this career and specifically in this specialty is an opportunity to care for these patients in a way that extends our inpatient efforts. Through hospital violence injury prevention (HVIP) programs, student mentorship and exposure, as well as national programs like Stop the Bleed, the field of trauma has started to recognize the limitations of medicine and surgery and considers the socioeconomic determinants of health on this community.

I want a career in acute care/trauma surgery because more than the surgery itself, I've found a specific purpose to my community—one of representation and hope, as well as wellness and advocacy. Through my experiences in mentorship, I show that being a physician is possible, practical and the hard work and delayed gratification is worth it. Through my work with HVIP, we know that perpetrators of gun violence are often former victims and providing equitable access to follow-up care disrupts that cycle. Lastly, through national programs like Stop the Bleed and explicit efforts on gun control reform, I've found a way to empower and advocate for minority and under-represented communities in ways that go beyond the hospital walls.

Truthfully, I still think that trauma surgeons are real-life superheroes, but the reasons why are far beyond their demeanor and the surgery. I have become equally passionate about providing care for my patients through programs and efforts that see people and communities as those who deserve equitable care and committed advocacy. I've always been thankful for the privilege of being chosen to do the work I do, and I'm excited for a long career that bears that fruit.
